

Quail Hunter Success Danger vs. Training Areas

Note: Quail hunter success in the Danger/Impact Areas during the period 1984-98 was only slightly lower than the Post-wide hunter success during the mid-70's. Hunter success is a much better indicator of quail populations than total harvest, as total harvest can fluctuate greatly with number of hunter attempts and Danger/Impact area access. Danger/Impact Area quail call counts surveys (independent of harvest data) conducted in the early 90's also suggest that quail population densities in the Danger/Impact Areas did not experience the radical declines seen post-wide.
